

Humidity Tip

This article was kindly donated by George Cardas

Get a humidity gauge. Your system will sound best if the room humidity is kept above 40%. Humidity helps kill the static in the room. Air conditioners and heaters (especially the wood burning stoves we have up here in Oregon) can suck all the moisture from your home. Throw a few plants into your listening room and spray them down. They'll raise the moisture content of the air and provide a little sound damping at the same time. I use ferns because they are large, have a lot of surface area and they're relatively cheap.
