

- If we were a megacorporation we would spend a \$10,000 or so to tool up for a die cutter to stamp these out by the thousand in some hitech plastic and sell them for \$100 each. But we are not, so please print them out yourself, ideally on a heavy Overhead Projector transparent foil and cut around the outside line with scissors.
- Then follow the three page User Instructions also available on our site.
- Cutting the center spindle hole to the required accuracy is nearly impossible, but this trick from *Dice 45* makes the job simple but extremely precise. Do not make a hole at all, just cut along the two red lines with a very fine bladed sharp knife, and push the circle area over the spindle. The material will bend up along the dotted line and make a very tight, accurate fit in exactly the correct location.
